The 24/7 Handover

01 WELCOME

You're one of 8 builders we picked. One problem we actually have at Zapdos, five and a half hours to crack it. Food, drinks and the hot pool are on us.

02 THE PROBLEM

Work gets dropped when it changes hands. One shift ends, someone else picks up, and things get lost: **what's done, what's next, and why.** We feel this every day, with a team split between Austin and Singapore.

03 THE SOLUTION YOU BUILD

AI that does real work around the clock. When it hands over, the next one carries on exactly where it left off, without asking anyone.

WIRE IT INTO THE TOOLS WE ACTUALLY USE

Granola · Slack · Linear · Email · Calendar · WhatsApp · Claude · Grok · any model

Everyone on the team gets their own AI, and work hands off to the right person's AI. How they're organized is your call: one lead AI, a team that talks, a shared board, something new. Go crazy, and tell us why at the demo.

04 IN BETWEEN: THE FUN PART

3:00 — Doors open
Food, beers, laptops out. Start building.

4:30 6:00 7:30 — Check-ins
We restart your AI fresh in front of everyone. Carries on: **ring the bell**. Gets stuck or asks you: **take a drink**.

All night — Hot pool
Bells on the TV. Breaks in the pool. No laptops in the water.

8:30 — Hands off
Keyboards down. It runs on its own while you demo. Winner at 9.

05 WHAT WE EXPECT

AT 8:30PM: SHOW IT END TO END

- **A call ends** notes land in Granola
- ↓ **Work gets made** tasks in Linear, the right teammate on each
- ↓ **People hear about it** Slack, WhatsApp
- ↓ **Things go out** follow-up email, next meeting on the calendar
- ↓ **The shift changes** the right person's AI picks it up and finishes it

Live, 3 minutes, nobody touching the keyboard.

HOW YOU'RE JUDGED

1. Does the handover work? Right person on each task, and it carries on without asking.
2. Does it run end to end? Real work done, with proof you can click.
3. Is it honest? Nothing made up.
4. Would we use it on Monday?

Ground rules: your laptop, your AI keys. Nothing goes to real customers; if it talks to a person, it says it's AI. Short agreement at the door. Max three drinks, no hot pool after two.

$250 **Best build wins,** and runs at Zapdos for a week. Anyone whose handover holds up all night gets a "come build with us" conversation. No interviews, no LeetCode. This is how we hire.

06 BACKGROUND: WHO WE ARE

Zapdos Labs builds vision workflows on cameras sites already own. Customers run shipyards, warehouses and factories in the US and Singapore.

07 HOW OUR WORK MOVES TODAY

A small team, about 13 hours apart. Each person below gets their own AI tonight:

- **Founder** · Austin · sales, pricing, investors
- **Engineer** · Singapore · installs, layouts, deploys
- **Sales caller** · US · calls, booked meetings
- **Content** · Singapore · posts, videos, case studies

Every customer call kicks off the same chain:

Granola call → Linear tasks → Slack update → Email → Calendar → WhatsApp (Singapore)

08 WHERE IT BREAKS: REAL EXAMPLES FROM THIS MONTH, NAMES SWAPPED

The call that ends at night.
6pm in Austin, a warehouse lead wants a camera layout and a price by Thursday, plus their site manager on the next call. Austin logs off. Singapore wakes up. Does the AI already know what's owed, to whom and by when? Has it handed each piece to the right person: the layout to the engineer, the price to the founder, the invite to whoever runs the call? And has it finished what it can on its own?

The double-booked afternoon.
An install is set for a Tuesday afternoon. A new prospect call gets booked right in the middle of it, by someone who didn't know. Nobody notices until the day before.

The proposal stuck on a price.
The engineer finishes the layout and the operator guide. It waits on a price from the founder, who is on a flight. Three days pass and the customer goes quiet.

The promise nobody else saw.
A one-pager was promised to a new lead by email. The engineer running the next call wasn't copied, so he walks in without it.

The money that sits.
A teammate pays for a site trip out of pocket. The claim needs one approval. It sits for two weeks because nobody owns it.

The person on leave.
Someone set up the alerts and the deploy, then went on two weeks' leave. The server goes down, and nobody knows how it was wired.

The helper that forgets.
Our AI drafts a perfect follow-up on Monday. On Tuesday a fresh one has no idea it exists and drafts it again.

09 THE TEST

Pick any of these. When the shift changes, does your AI know what's owed, to whom and by when? Does it put the right teammate on each piece, and finish the rest without asking anyone?

Done means: it runs end to end, live, survives three fresh restarts, and nothing in it is made up.

10 SCOPE

IN

- One loop: a customer call and everything after it, across a shift change
- Granola, Slack, Linear, email, calendar. WhatsApp is a bonus
- Any models, one AI or many working together
- Our sample work: call notes, an inbox, a Slack and Linear backlog

OUT

- Cameras and hardware. Not tonight
- Real customers or our live accounts
- A pretty interface. A terminal is fine
- A new chat app. Work inside the tools above
